Title - Analyze Global Life Expectancy Data to Find Major Factors

Objective

The objective of this project is to analyze global life expectancy data and identify the major factors affecting people's lifespan, such as healthcare, education, GDP, and mortality rates.

Dataset Description

The dataset contains information about different countries, including life expectancy, adult mortality, infant deaths, schooling, GDP, immunization, and healthcare-related factors. It helps us understand the differences in life expectancy across countries.

Approach and Techniques Used

Python libraries like Pandas, NumPy, and Matplotlib are used for data cleansing, analysis, and visualization, correlation analysis is used to find relationship between life expectancy and other factors.

Key Findings and Insights

Better healthcare, education, immunization and economic conditions are linked with higher life expectancy. Higher mortality rates are linked with lower life expectancy.

Conclusion

Life expectancy is affected by healthcare, education, economy, and mortality rates. Improving these factors can help people live longer and healthier lives.
